COURSE ON IMAGING IN RHEUMATIC DISEASES

www.rheuma-imaging.com

Targets

This two-day course is designed for rheumatologists and others interested in articular and related disorders both of the peripheral and central skeleton.

International authorities will explore the role of a variety of imaging modalities in the assessment of these disorders, the modalities including conventional radiography, ultrasonography, CT scanning, and MR imaging.

Articular, metabolic, endocrine, degenerative, traumatic, stress-related, and neurologic diseases will be covered in focused sessions that will serve to lead to earlier and more accurate diagnosis, and important points of differential diagnosis will be discussed.

Newer concepts such as femoroacetabular impingement, recently identified complications of joint surgery, and dysfunction of the muscle – tendon – enthesal unit will be included.

At the conclusion of the course, the attendees should have a much greater knowledge base and understanding of the manner in which imaging methods can be applied to the assessment of their patients with articular and related disorders.

We will have diffusion through Univadis, and also we will do broadcast through their platform.
